

Slow speed mixers

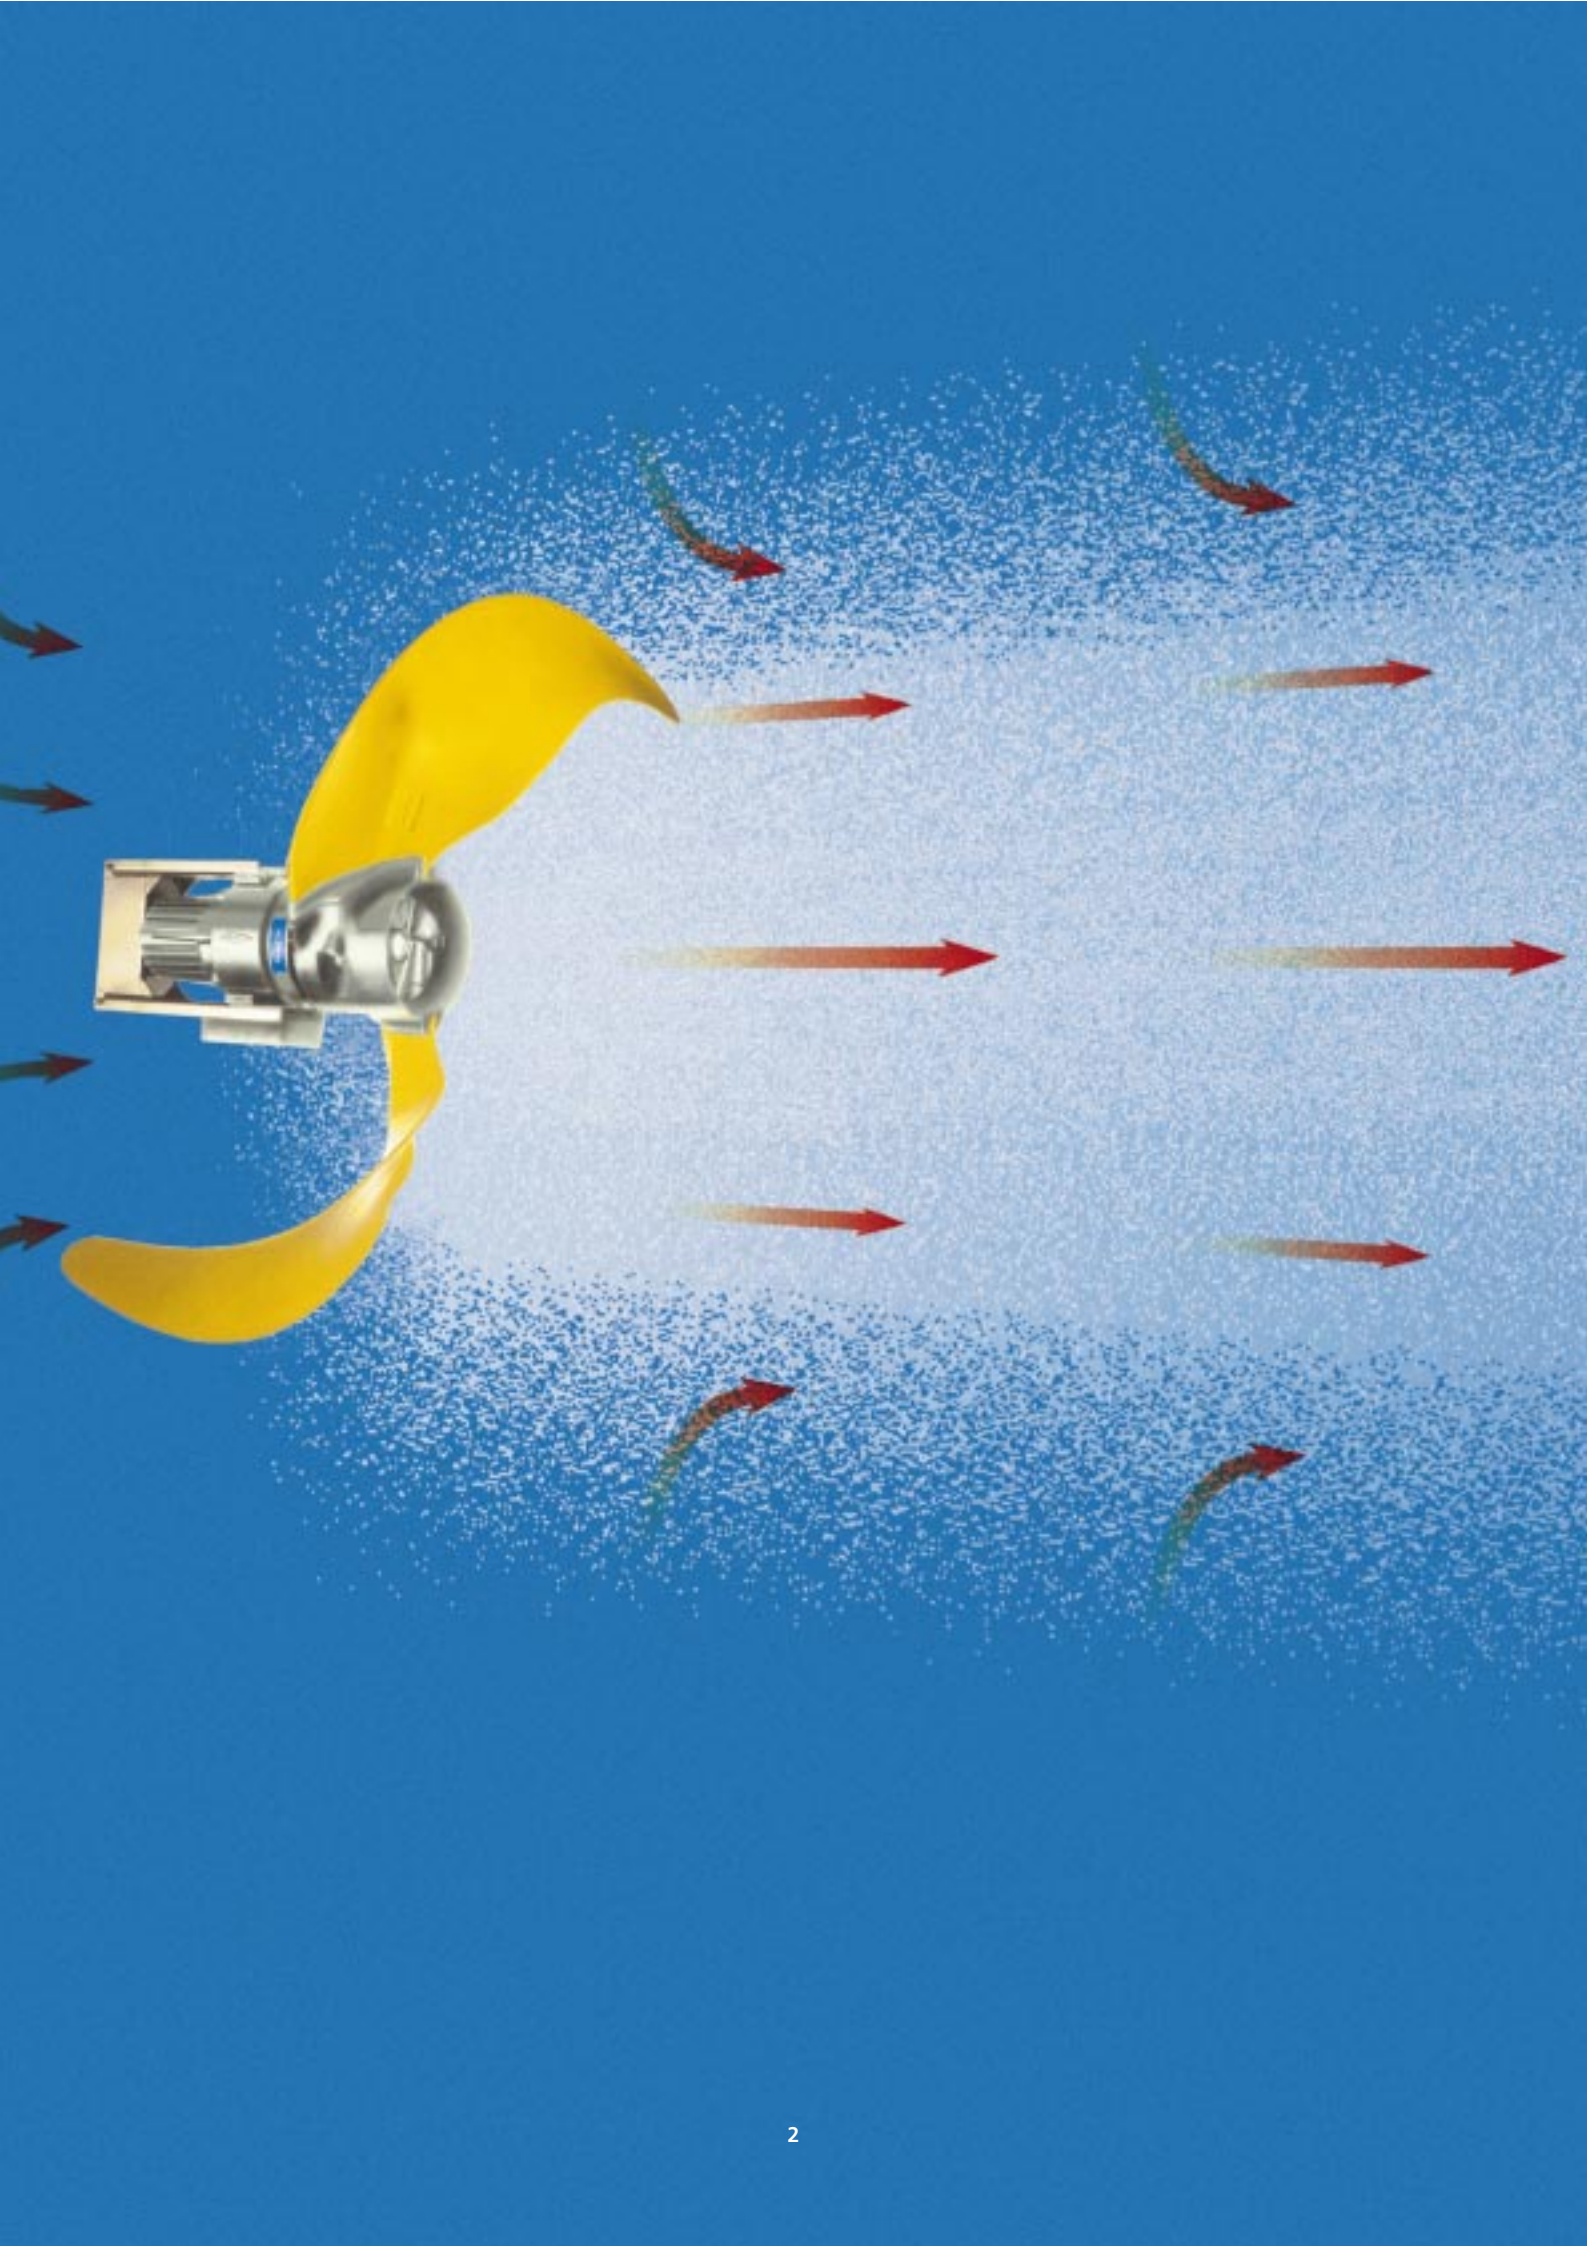

A range for outstanding efficiency

Flygt

ITT Industries
Engineered for life

Better mixing and reduced power consumption

Allowing the mixer jet to develop leads to a good bulk flow and efficient mixing of the entire tank.

Compared to dry-mounted mixers, submersible solutions offer greater flexibility and considerable savings in energy consumption for a wide range of mixing applications, such as solids suspension, bottom erosion, blending, circulation or destratification.

How does mixing work?

All mixing applications require varying degrees of both small-scale turbulence and bulk flow. With a good bulk flow, the contents of the entire tank are put in motion so that all parts are involved in the mixing. Most mixing applications generate abundant turbulence and it is the strength of the bulk flow that controls the efficiency of the mixing. The performance of a submersible mixer is measured by the thrust (N) that it produces. So the strength of the bulk flow is in turn dependent on the total amount of installed thrust.

Submersible mixers mean more efficient bulk flow

Submersible mixers allow a great deal of flexibility in positioning and orientation, unlike their dry-mounted counterparts. The mixer jet can be positioned to develop over a long distance and adapted to the shape of the tank. This ensures the creation of a maximum level of bulk flow. The result: more efficient mixing and lower power consumption.

Fast, easy installation

The most frequently-used installation method employed with the Flygt 4410 and 4430 mixers is the guide bar with the mixer being easily raised and lowered. This method gives easy accessibility for servicing.

The submersible route to lower capital investment

Using a submersible mixing solution presents a number of cost advantages over traditional dry-mounted mixer alternatives. The installation method is quick and easy and requires low capital investment. A minimum number of units are required to mix very large volumes, thus further reducing the costs associated with the installation.

No costly modifications

Thanks to the flexibility of the installation method, Flygt mixing equipment can be used in existing tanks without the need for expensive alterations to the site.

Single guide bar system
A frequently used solution that eliminates any risk of fatigue, yet provides a cost efficient installation.

Double guide bar system
Rigid design that also allows installation of multiple mixers at different depths.

Every detail ensures the highest reliability

Inner shaft seals

Shaft seals between stator and gear box, and between gear box and seal housing.

Electric motor

Squirrel cage induction motor with thermal overload protection.

Cable entry

Compressible bushing and strain relief on the cable prevent leakage into the motor.

Outer shaft seal

Mechanical shaft seal between surrounding liquid and seal housing.

Seal housing

Seal housing containing barrier fluid. This fluid also lubricates and cools the seal.

Gear box

Designed for over 100,000 hours operation, according to ISO and AGMA standards.

Propeller

Thin-sectioned, double-curved blades with a unique design for maximum efficiency and clog-free operation.

Maximum efficiency from a unique design

In almost all applications, the mixing result depends on a good bulk flow being generated throughout the tank. In turn, the strength of this bulk flow depends on the thrust of the mixer. The hydraulic efficiency, speed and diameter of the propeller together determine the cost in power consumption of the generated thrust.

ITT Flygt's banana blade mixers combine excellent hydraulic design together with large diameters and slow speed. The banana blade mixer is therefore the optimum choice for generating the absolute maximum of thrust with the minimum of power consumption.

This efficiency also has to be maintained when operating in fibrous material, where clogging could be a problem. So the swept-back design of Flygt banana blade propellers also provides exceptional self-cleaning properties.

State-of-the-art design for best performance

The Flygt design solution relies on material bonding technology, employing fibreglass-reinforced polyurethane. This results in maximum strength with optimum hydraulic efficiency.

The banana blade design is meticulously verified.

Mixers from ITT Flygt have well proven performance data.

Seals engineered for the job

Shaft seals are a crucial component in the reliable operation of any submersible mixer. Flygt 4410 and 4430 banana blade mixers employ our own unique mechanical shaft seal design with an intermediate barrier fluid.

Why do seals wear out?

Theoretically, the surfaces of mechanical seals should be constantly divided by a thin film of liquid. In practice, there is always some direct contact which leads to wearing of the seal surfaces. This is why the choice of material, and its sliding properties, is extremely important to the longevity of a mechanical seal.

Tungsten Carbide: the choice for longer life

Flygt banana blade mixers are equipped with shaft seals manufactured from corrosion-resistant tungsten carbide (WCCR). Other material choices available from mixer manufacturers include silicon carbide (SiC), but for the kind of applications where Flygt banana blade mixers are used, WCCR provides the optimum choice.

The reason can be found in WCCR's superior sliding properties. This factor results in significantly less wear between the two seal surfaces, and thus, offers a longer operational life with less risk of leakage. WCCR also offers better mechanical strength and is far less brittle or prone to handling damage. The addition of a chromium, nickel and molybdenum binder in the material also ensures excellent corrosion resistance down to a pH of 3.

	Bending strength (MPa)	Fracture toughness (MPam ^{1/2})
WCCR	2600	18
SiC*	390	4.5

WCCR has superior mechanical properties.

Tough coatings that are gentle on the environment

The drive units (the motor and gearbox) of Flygt 4410 and 4430 banana blade mixers are built of grey cast iron. To prevent corrosion in varying applications, a resistant coating is required. In choosing suitable coatings, great care has been taken to ensure that any chemicals used do not present a hazard to the environment.

Standard coating

Where a standard coating is used, the cast iron parts are first sand-blasted and then dipped in a corrosion-preventive primer. The oxiranester top coating is characterised by high mechanical strength and impact resistance, as well as offering good protection against chemicals.

The oxiranester coating also offers environmental advantages during the manufacturing process. Compared with alternative coatings, the emission of solvents and volatile organic compounds is substantially reduced. Oxiranester does not pose a risk of cancer and does not promote allergies.

Epoxy coating

Applications with chloride levels $>200\text{ppm}$, will call for extra corrosion protection. In these cases an alternative coating can be chosen. The standard primer is replaced with a zinc-rich epoxy primer which provides increased anodic corrosion protection. Oxiranester is still used as a top coating because of its excellent properties, but here it is applied in three layers. When chlorides exceed 500ppm , these mixers should also be equipped with zinc anodes.

Outstanding performance with the banana blade

ITT Flygt conceived the concept of the slow speed banana blade mixer for gentle mixing of large volumes. Over the years the concept has been developed and perfected, and today the Flygt range of 4410 and 4430 banana blade mixers offer highly energy-efficient solutions for a wide range of mixing applications, such as:

- Biological treatment tanks
- Sludge holding tanks
- Equalisation tanks
- pH stabilisation tanks
- Chlorination basins
- Chemical flocculation
- Water reservoirs
- Ice prevention
- and many more.

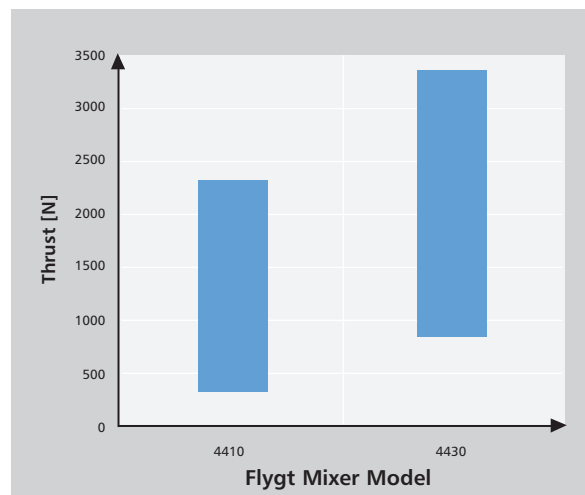

Model	4410 Mixer	4430 Mixer
Shaft power	50 Hz, 2.3 kW 60 Hz, 2.6 kW/3.5 hp	50 Hz, 4.3 kW 60 Hz, 4.6 kW/6.2 hp
Max. nominal thrust	50 Hz, 2.2 kN 60 Hz, 2.4 kN/530 lb	50 Hz, 3.3 kN 60 Hz, 3.4 kN/760 lb
Propeller diameter	1400 mm to 2500 mm 55 ¹ / ₈ " to 98 ³ / ₈ "	1400 mm to 2500 mm 55 ¹ / ₈ " to 98 ³ / ₈ "

4410 and 4430 Mixers

The mixers are available with different motor alternatives. Eight different gear ratios are offered, and propeller diameters range from 1400 mm to 2500 mm (55¹/₈" – 98³/₈").

By combining different motors, gear ratios and propeller diameters, the modular design of Flygt banana blade mixers allows for a comprehensive selection of mixer performance.

Making your equipment even easier to work with

Installation accessories should be rigid enough to withstand the weight and reaction forces exerted by the mixer throughout its operating life. Professional operators also need the equipment to be easy to work with for installation as well as inspection and service.

Well proven reliability

Strong fluctuating forces act on all large diameter mixers. So installed equipment must be capable of withstanding fatigue. Flygt's installation accessories have proven themselves in thousands and thousands of installations.

Convenient and safe lifting equipment

ITT Flygt provides equipment that enables convenient lifting and handling of mixers.

The safety is guaranteed with the CE marking, the European sign for safety approval.

The lifting davit is mounted in a holder at its lower end which enables easy turning of the davit. To raise the mixer, the davit is fitted with either a winch or a pulley block.

To reduce investment cost, one davit can be used for several mixers. Mixers can be left submerged without being suspended by the lifting wire. A Flygt patented lifting device guarantees the connection to the mixer's lifting bail.

Trouble-free operation, year after year

Local service network – worldwide

The service and maintenance of equipment is a key factor in any professional operation. At ITT Flygt we offer an unparalleled worldwide network, so that there is always a professional service centre close to your operations, with fully equipped workshops and trained service engineers.

Total service concept

Every mixer installation and system is different and so are the levels of service and support that you may require. With ITT Flygt, you can choose the level of service to suit your needs. From simply supplying mixers, to full service assistance and maintenance, ITT Flygt's total service concept means the service you require, on your terms.

Easier servicing – check the web

In the design stages of our mixers, we pay great attention to the ability of offering prompt and easy on-site service. This, in combination with the availability of service kits means minimum downtime. For customers who wish to service their own mixers, extensive Workshop and Care & Maintenance manuals are available, as printed matter or at www.flygt.com.

15-year spare parts guarantee

We guarantee the availability of spare parts for 15 years after the production of a mixer has stopped. Just another way that ITT Flygt guarantees its long-term commitment to its customers.

ITT Flygt is the world's leading manufacturer and supplier of submersible pumping and mixing solutions. Flygt submersible pumps, mixers and aeration systems are used in wastewater plants, sewage systems and numerous other applications.

Our experience is utilized by engineers, planners and consultants to ensure reliable and cost-effective operation of our solutions. ITT Flygt has sales and service facilities in more than 130 countries.
